Unique Songs	Unique Artists	Days Tracked	Avg Popularity	Avg Chart Stay	Explicit Content

 KEY FINDINGS

Popularity ≠ Chart Rank	Spotify popularity score and chart rank are nearly uncorrelated ($r = -0.094$, $R^2 = 0.01$). A song's global popularity explains less than 1% of its US rank variance. These are independent KPIs requiring separate monitoring and strategy teams.
Three Artists Own 20% of the Playlist	Taylor Swift (7.26%), Zach Bryan (6.69%), and Morgan Wallen (6.01%) collectively hold ~20% of all playlist slots. Taylor Swift achieves this via catalog breadth (96 songs); Morgan Wallen via hit concentration (just 10 songs). Both strategies work but require different investment timelines.
Clean Songs Chart 28 Days Longer	Clean tracks average 163 days on chart vs. 135 days for explicit (+20.7%). This longevity gap is driven by expanded eligibility family playlists, radio, all-ages editorial. The revenue tail of a clean version is significantly longer at near-zero additional production cost.
Half of All Songs Vanish in 12 Days	The median chart stay is just 12 days. The mean (27 days) is inflated by perennial outliers like Something in the Orange by Zach Bryan (536 days). Songs that survive beyond 30 days are 3× more likely to become long-tail streaming assets.
Singles Dominate, 2–4 Min is the Sweet Spot	Singles account for the majority of chart appearances. Songs in the 2–4 minute range achieve the highest average popularity scores. Album tracks and songs exceeding 5 minutes significantly underperform on this playlist.
Sabrina Carpenter: The Benchmark for New Artists	Rising from outside the top 10 to #4 dominance (967 appearances, 3.48%) within the tracked period, Sabrina Carpenter demonstrates that a new artist with strong singles and crossover strategy can break the top tier in under a year.

✓ **PRIORITY RECOMMENDATIONS**

1

Always release a clean version simultaneously

+28 days average chart longevity = 4+ extra weeks of streaming revenue per release at near-zero incremental cost.

2

Concentrate promotional spend in the first 30 days

Half of songs are gone in 12 days. Sync outreach, creator campaigns, and editorial pitching must be front-loaded to the launch window not ramped up after week 2.

3

Stop using popularity score as a US chart proxy

$r = -0.094$ means global popularity is not a reliable indicator of US playlist health. Assign a dedicated US chart rank KPI owner separate from global metrics.

4

Target 2–4 minute singles for chart placement

This duration range achieves the highest average popularity on this playlist. Album tracks and long-form releases should not be the primary chart strategy for new Atlantic artists.

5

Build one inescapable hit before catalog investment

Morgan Wallen's model (10 songs, 6.01% dominance) proves hit concentration is as powerful as catalog breadth in the short-to-medium term and achievable without a decade of releases.
